

## **GPON OLT Optical Transceiver SFP Module**

### ***RTXM167-522***

---

#### **Features**

- *Integrated Single fiber bi-directional optical subassembly*
- *1310nm Burst-mode APD/TIA receiver and 1490nm Continuous DFB laser Transmitter (with WDM)*
- *SFP metallic package*
- *0 to 70°C operating ambient temperature*
- *Single SC receptacle optical interface compliant*
- *Hot-pluggable*
- *+3.3V single power supply*
- *Low power consumption*
- *Fast settling time with immunity to long streams of CID*
- *Guard time squelched function*
- *Digitalized burst mode optical power monitoring*
- *LVPECL compatible data input and output interface*
- *LVTTTL receiver reset control*

- *LVTTL receiver*
- *burst-power-detect indication*
- *Class 1 Laser eye safety standard*
- *Excellent EMI and EMC*
- *characteristics*
- *ESD protection function*
- *RoHs compliant*

## Application

- *Optical transceiver for Gigabit-capable Passive Optical Networks (GPON) Class B+ OLT side*

## Standard

- *ITU-T G.984.2 Class B+*
- *Small Form-factor Pluggable (SFP) Transceiver Multisource Agreement July 5, 2000*

## Description

The GPON OLT Transceiver is designed for Gigabit-capable Passive Optical Network (GPON) transmission. The module incorporates 1490nm DFB continuous-mode transmitter and 1310nm burst-mode APD receiver.

The transmitter section uses a high efficiency 1490nm DFB laser and an integrated laser driver which is designed to be class-1 eye safety under any single fault. The laser driver includes APC and temperature compensation functions, which are used for keeping the launch optical power and extinction ratio constant over temperature and aging.

The receiver section uses an integrated APD detector and burst mode preamplifier mounted together. To provide fast settling time with immunity to long streams of Consecutive Identical Digits(CID), the receiver requires a reset signal provided by the media access controller(MAC). The receiver has fast SD function, the rising time is about 5ns, when reset signal arrived, the SD signal will be turned to low, and the noise in the guard time will be squelched.

The receiver includes digitalized burst mode optical power monitoring function, which converses any of a received ONU optical power directly in digital, with a Trigger input from system. When rising edge of Trigger detected, the DDM processor starts a burst optical power conversion, the digital result is available via DDM interface after Burst Optical Power Conversion Time. Trigger pulse width should be more than Burst Optical Power Conversion Holding Time.

An integrated WDM coupler can distinguish 1310nm input light from 1490nm output light.

The metallic package guarantees excellent EMI and EMC characteristics, which totally comply with international relevant standards.

## Absolute Maximum Ratings

Parameter	Symbol	Unit	Min	Max
Operating Temperature Range	T <sub>c</sub>	°C	0	70

128-247	120	User writable EEPROM	
248-255	8	Vendor Specific	Don't Access

The measured values located at bytes 96-105 (in the 2 wire address 0xA2) are raw A/D values (16-bit integers) of transceiver temperature, supply voltage, laser bias current, laser optical output power and received power. All the measured values are "Externally Calibrated", and then it is necessary to convert raw A/D values to real world units by the manner as shown in Table 2.1

**Table 2.1 Real Time Diagnostic Monitor Values**

Byte Name	Description
96 Temperature MSB	Internally measured transceiver temperature. Comply with External Calibration of SFF-8472.
97 Temperature LSB	
98 Vcc MSB	Internally measured supply voltage. Comply with External Calibration of SFF-8472.
99 Vcc LSB	
100 Laser Bias MSB	Measured Laser bias current. Comply with External Calibration of SFF-8472.
101 Laser Bias LSB	
102 Tx Power MSB	Measured Tx power. Comply with External Calibration of SFF-8472.
103 Tx Power LSB	
104 Rx Power MSB	Measured Rx power. Comply with External Calibration of SFF-8472.

**105 Rx Power LSB**

This transceiver implements two optional status bytes, “Logic States” at byte 110(0xA2)” and “A/D Updated” at byte 111(0xA2) as shown in Table 2.2. “A/D Updated” status bits allow the user to verify if an update from the analog-digital conversion has occurred of the measured values, temperature, Vcc, laser bias, Tx power and Rx power. The user writes the byte to 0x00. Once a conversion is completed for a given value, its bit will change to ‘1’.

**Table 2.2 Logic Status and AD Conversion Updates**

Byte	Bit	Name	Description
110	7	Tx Disable State	Optional digital State of the Tx Disable input pin.
110	6	Soft Tx Disable Control	Not supported (set to 0).
110	5	Reserved	Set to 0.
110	4	Rx Rate Select State	Not supported (set to 1).
110	3	Soft Rate Select Control	Not supported (set to 0).
110	2	Tx Fault	Optional digital state of the Tx Fault output pin.
110	1	LOS	Not supported.
110	0	Power on Logic	Bit will be 0 when the analog monitoring is active.
111	7	Temp A/D Valid	Indicates A/D value in Bytes 96/97 is valid.
111	6	Vcc A/D Valid	Indicates A/D value in Bytes 98/99 is valid.
111	5	Laser Bias A/D Valid	Indicates A/D value in Bytes 100/101 is valid.
111	4	Tx Power A/D Valid	Indicates A/D value in Bytes 102/103 is valid.
111	3	Rx Power A/D Valid	Indicates A/D value in Bytes 104/105 is valid.
111	2	Reserved	Set to 0.
111	1	Reserved	Set to 0.
111	0	Reserved	Set to 0.

Each of the measured values has a corresponding high alarm, low alarm, high warning and low warning threshold level at location 00-39(0xA2) written as the data format of a corresponding valued shown in Table 2.3. Alarm and warning flags at bytes 112-119(0xA2) are defined as follows.

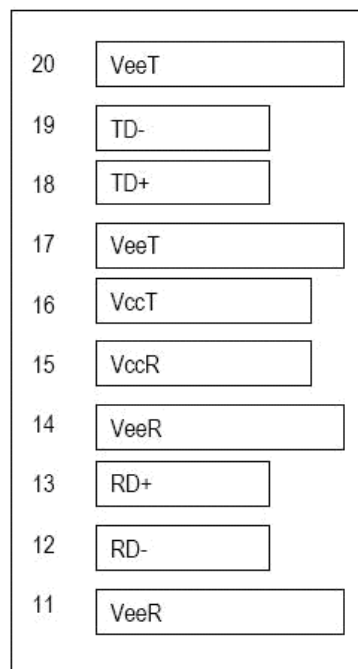

- (1) Alarm flags indicate conditions likely to result (or have resulted) in link failure and cause for immediate action.
- (2) Warning flags indicate conditions outside the guaranteed operating specification of transceiver but not necessarily causes of immediate link failures.

**Table 2.3 Alarm and Warning Flags**

Byte	Bit(s)	Name	Description
112	7	Temperature High Alarm	Set when temperature monitor value exceeds high alarm level.
112	6	Temperature Low Alarm	Set when temperature monitor value exceeds low alarm level.
112	5	Vcc High Alarm	Set when Vcc monitor value exceeds high alarm level.
112	4	Vcc Low Alarm	Set when Vcc monitor value exceeds Low alarm level.
112	3	Laser Bias High Alarm	Set when laser bias monitor value exceeds high alarm level.
112	2	Laser Bias Low Alarm	Set when laser bias monitor value exceeds low alarm level.
112	1	Tx Power High Alarm	Set when Tx power monitor value exceeds high alarm level
112	0	Tx Power Low Alarm	Set when Tx power monitor value exceeds low alarm level.
113	7	Rx Power High Alarm	Set when Rx power monitor value exceeds high alarm level

113	6	Rx Power Low Alarm	Set when Rx power monitor value exceeds low alarm level
113	5-0	Reserved	All bits set to 0.
114	7-0	Reserved	All bits set to 0.
115	7-0	Reserved	All bits set to 0.
116	7	Temperature High warning	Set when temperature monitor value exceeds high warning level.
116	6	Temperature Low warning	Set when temperature monitor value exceeds low warning level.
116	5	Vcc High warning	Set when Vcc monitor value exceeds high warning level.
116	4	Vcc Low warning	Set when Vcc monitor value exceeds Low warning level.
116	3	Laser Bias High warning	Set when laser bias monitor value exceeds high warning level.
116	2	Laser Bias Low warning	Set when laser bias monitor value exceeds low warning level.
116	1	Tx Power High warning	Set when Tx power monitor value exceeds high warning level
116	0	Tx Power Low warning	Set when Tx power monitor value exceeds low warning level.
117	7	Rx Power High warning	Set when Rx power monitor value exceeds high warning level
117	6	Rx Power Low warning	Set when Rx power monitor value exceeds low warning level
117	5-0	Reserved	All bits set to 0.
118	7-0	Reserved	All bits set to 0.
119	7-0	Reserved	All bits set to 0.

## Pin Description

Top of Board

Bottom of Board (as viewed thru top of board)

Pin	Name	Function/Description	Engagement order	Notes
1	VeeT	Transmitter Ground	1	
2	TX Fault	Transmitter Fault Indication	3	1
3	TX Disable	Transmitter Disable-Module disables on high or open	3	2

4	MOD-DEF2	Module Definition 2-Two wire serial ID interface	3	3
5	MOD-DEF1	Module Definition 1-Two wire serial ID interface	3	3
6	MOD-DEF0	Module Definition 0-Two wire serial ID interface	3	3
7	Reset	Reset signal input	3	8
8	BPD	Burst Power Detect (active HIGH)	3	4
9	Trigger	Trigger input of burst signal packet received	3	9
10	VeeR	Receiver Ground	1	
11	VeeR	Receiver Ground	1	
12	RD-	Inverted Received Data out	3	5
13	RD+	Received Data out	3	5
14	VeeR	Receiver Ground	1	
15	VccR	Receiver Power supply, +3.3V±5%	2	6
16	VccT	Transmitter Power supply, +3.3 V±5%	2	6
17	VeeT	Transmitter Ground	1	
18	TD+	Transmitter Data In	3	7
19	TD-	Inverted Transmitter Data In	3	7
20	VeeT	Transmitter Ground	1	

**Note1:** TX Fault is open collector/drain output which should be pulled up externally with a 4.7K – 10K  $\Omega$  resistor on the host board to supply <math>V\_{ccT}+0.3V</math> or <math>V\_{ccR}+0.3V</math>. When high, this output indicates a laser fault of some kind. Low indicates normal operation. In the low state, the output will be pulled to <math><0.8V</math>.

**Note2:** TX Disable input is used to shut down the laser output per the state table below. It is pulled up within the module with a 4.7 ~ 10K resistor.

Low (0 – 0.8V):            Transmitter on  
 Between (0.8V and 2V): Undefined  
 High (2.0 – VccT):        Transmitter Disabled  
 Open :                        Transmitter Disabled

**Note3:** Mod-Def 0, 1, 2. These are the module definition pins. They should be pulled up with a 4.7 - 10K resistor on the host board to supply less than <math>V\_{ccT}+0.3V</math> or <math>V\_{ccR}+0.3V</math>.

Mod-Def 0 is grounded by the module to indicate that the module is present.

Mod-Def 1 is clock line of two wire serial interface for optional serial ID.

Mod-Def 2 is data line of two wire serial interface for optional serial ID.

**Note4:** BPD (Burst Power Detect) is pulled up internally with a 10K resistor to VccR. When LOW, this output indicates the received optical power is below the worst case receiver sensitivity (as defined by the standard in use). HIGH indicates normal operation. In the low state, the output will be pulled to <math><0.8V</math>.

**Note5:** RD-/+: These are the differential receiver outputs. They are DC coupled 100  $\Omega$  differential lines which should be terminated with 100  $\Omega$  differential at the user SERDES. The DC coupling is done inside the module and require LVPECL terminal on the host board.

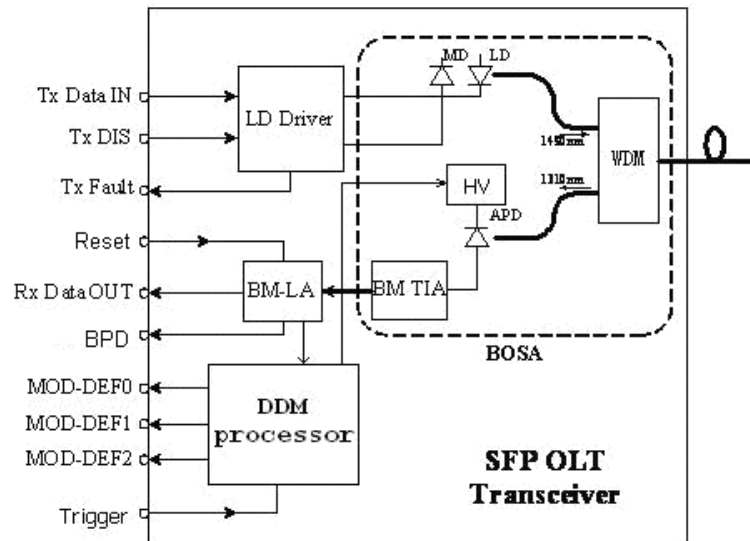

**Note6:** VccR and VccT are the receiver and transmitter power supplies. They are defined as 3.3V±5% at the SFP connector pin. The in-rush current will typically be no more than 30mA above steady state supply current after 500ns.

**Note7:** TD-/+: These are the differential transmitter inputs. They are AC coupled differential lines with 100  $\Omega$  differential termination inside the module. The AC coupling is done inside the module and is thus not required on host board.

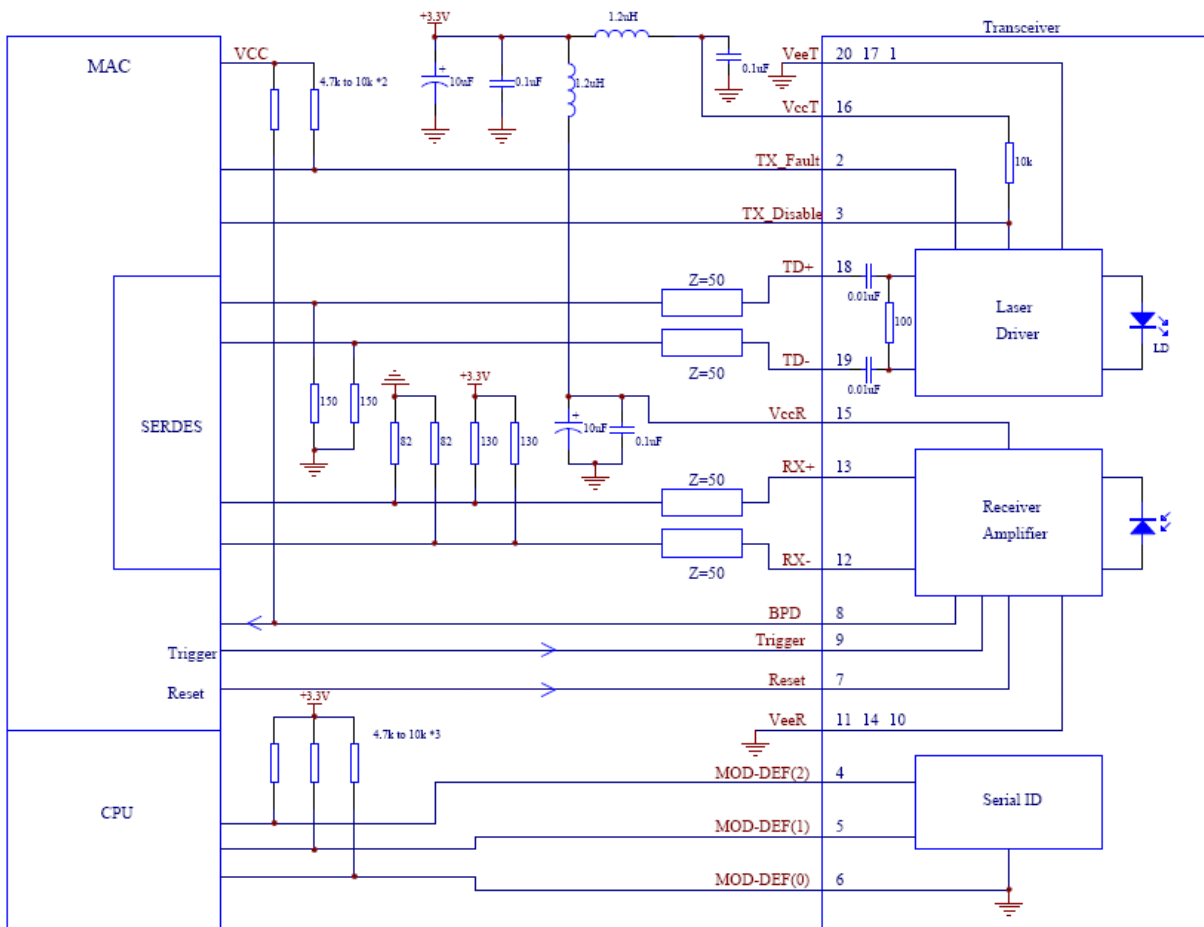

**Note8:** Reset input compliant with LVTTTL. It will be asserted HIGH at the end of a burst packet.

**Note9:** Trigger input compliant with LVTTTL. One positive pulse will issue a burst optical power conversion.
